

# 1 $p = 3, 3 \mid n, n - 1$ case full argument

## 1.1 Generators

Let  $x_1, \dots, x_{n-1}$  be a basis for the  $n - 1$  dimensional representation of  $S_n$  derived from the standard representation with basis  $e_0, \dots, e_{n-1}$  by the relation  $x_i = e_i - e_0$  and the action of the symmetric group defined accordingly. Let  $s_{ij}$  be the transposition of  $i$  and  $j$ , for  $0 \leq i < j \leq n - 1$ .

For  $1 \leq i < j \leq n - 1$ , the relevant eigenvectors are  $x_i - x_j$ . For  $s_{0i}$  for  $1 \leq i \leq n - 1$ , the relevant eigenvector is  $x_i$ .

Let  $f_a$  for  $a = 1, \dots, n - 1$  be  $f_a = -x_a^3 + c \left( \sum_{i=1}^{n-1} x_a x_i (x_a - x_i) \right) + c^2 \left( \sum_{i=1}^{n-1} \sum_{j=1}^{n-1} x_i x_j x_a \right)$ . We will show that all the  $f_a$  are killed by Dunkl operators. Because of their symmetry, we need only consider  $f_1$ . Since  $f_1$  is symmetric in the  $x_i$  excluding  $x_1$ , the only Dunkl operators we need consider are  $D_1, D_2$ .

We note that  $f_1$  is preserved by  $s_{ij}$  for all  $i, j > 1$ . We consider  $s_{1a}$  for  $2 \leq a$ . We see that  $s_{1a} f_1 = -x_a^3 + c \left( \sum_{i=1}^{n-1} x_a x_i (x_a - x_i) \right) + c^2 \left( \sum_{i=1}^{n-1} \sum_{j=1}^{n-1} x_i x_j x_a \right) = f_a$ . Then:

$$\begin{aligned} f_1 - f_a &= -(x_1 - x_a)^3 + c \left( \sum_{i=1}^{n-1} x_1 x_i (x_1 - x_i) - x_a x_i (x_a - x_i) \right) + c^2 \left( \sum_{i=1}^{n-1} \sum_{j=1}^{n-1} x_i x_j (x_1 - x_a) \right) \\ &= -(x_1 - x_a)^3 + c \left( \sum_{i=1}^{n-1} x_i (x_1 + x_a - x_i) (x_1 - x_a) \right) + c^2 \left( \sum_{i=1}^{n-1} \sum_{j=1}^{n-1} x_i x_j (x_1 - x_a) \right) \end{aligned}$$

Then  $\frac{f_1 - s_{1a} f_1}{x_1 - x_a} = -(x_1 - x_a)^2 + c \left( \sum_{i=1}^{n-1} x_i (x_1 + x_a - x_i) \right) + c^2 \left( \sum_{i=1}^{n-1} \sum_{j=1}^{n-1} x_i x_j \right)$ .

We consider  $s_{0a}$  for  $2 \leq a$ . We see that  $s_{01}$  sends  $x_a$  to  $-x_a$  and  $x_i$  for  $i \neq a$  to  $x_a - x_1$ . We see that  $s_{0a} f_1 = -x_1^3 + c \left( \sum_{i=1}^{n-1} x_1 x_i (x_1 - x_i) \right) + c^2 \left( \sum_{i=1}^{n-1} \sum_{j=1}^{n-1} x_i x_j x_1 \right)$ .

The only remaining case to consider is  $s_{01}$ . We see that  $s_{01}$  sends  $x_1$  to  $-x_1$  and  $x_a$  for  $a \geq 2$  to  $x_a - x_1$ . Then  $s_{01} f_1$  goes to

$$\begin{aligned}
& -(-x_1)^3 + c \left( \sum_{i=2}^{n-1} (-x_1)(x_i - x_1)(-x_1 - (x_i - x_1)) \right) + c^2 \left( \sum_{i=2}^{n-1} \sum_{j=2}^{n-1} (x_i - x_1)(x_j - x_1)(-x_1) \right) + \\
& 2c^2 \left( \sum_{i=2}^{n-1} (x_i - x_1)x_1^2 \right) + c^2(-x_1)^3 \\
& = x_1^3 + c \left( \sum_{i=2}^{n-1} x_1 x_i (x_i - x_1) \right) + c^2 \left( \sum_{i=2}^{n-1} \sum_{j=2}^{n-1} -x_i x_j x_1 + x_i x_1^2 + x_j x_1^2 - x_1^3 \right) + \\
& 2c^2 \left( \sum_{i=2}^{n-1} (x_i - x_1)x_1^2 \right) + 2c^2 x_1^3 \\
& = x_1^3 + c \left( \sum_{i=2}^{n-1} x_1 x_i (x_i - x_1) \right) + c^2 \left( \sum_{i=1}^{n-1} \sum_{j=1}^{n-1} -x_i x_j x_1 \right) \\
& = -f_1
\end{aligned}$$

The above used the fact that  $n-2 \equiv 1 \pmod{3}$ . Therefore  $\frac{f_1 - s_{01}f_1}{x_1} = 2f_1/x_1 = -f_1/x_1 = x_1^2 + c \left( \sum_{i=1}^{n-1} x_i(x_i - x_1) \right) - c^2 \left( \sum_{i=1}^{n-1} \sum_{j=1}^{n-1} x_i x_j \right)$ .

We can use these to calculate the effects of the Dunkl operators.

## 1.2 Dunkl operators

### 1.2.1 $D_1 f_1$

We first consider  $D_1 f_1 = \partial_1 f_1 - c \sum_{a>1} \frac{f_1 - s_{1a}f_1}{x_1 - x_a} - c \frac{f_1 - s_{01}f_1}{x_1}$ . Let  $G_1 = \sum_{a>1} \frac{f_1 - s_{1a}f_1}{x_1 - x_a}$ ,  $G_2 = \frac{f_1 - s_{01}f_1}{x_1}$ . We wish to show that  $\partial_1 f_1 = cG_1 + cG_2$ , since then  $D_1 f_1 = 0$ . We calculate  $\partial_1 f_1$ :

$$\begin{aligned}
\partial_1 f_1 &= \partial_1 \left( -x_1^3 + c \left( \sum_{i=1}^{n-1} x_1 x_i (x_1 - x_i) \right) + c^2 \left( \sum_{i=1}^{n-1} \sum_{j=1}^{n-1} x_i x_j x_1 \right) \right) \\
&= c \left( \sum_{i=2}^{n-1} x_1 x_i + x_i (x_1 - x_i) \right) + c^2 \left( \sum_{i=2}^{n-1} \sum_{j=2}^{n-1} x_i x_j \right) + 2c^2 \left( \sum_{i=2}^{n-1} 2x_i x_1 \right) \\
&= c \left( \sum_{i=2}^{n-1} x_1 x_i + x_i x_1 - x_i^2 \right) + c^2 \left( \sum_{i=2}^{n-1} \sum_{j=2}^{n-1} x_i x_j \right) + c^2 \left( \sum_{i=2}^{n-1} x_i x_1 \right) \\
&= c \left( \sum_{i=2}^{n-1} -x_1 x_i - x_i^2 \right) + c^2 \left( \sum_{i=2}^{n-1} \sum_{j=1}^{n-1} x_i x_j \right)
\end{aligned}$$

We also see that  $G_1 = \sum_{a>1} \frac{f_1 - s_{1a}f_1}{x_1 - x_a} = \sum_{a=2}^{n-1} -(x_1 - x_a)^2 + c \left( \sum_{i=1}^{n-1} x_i (x_1 + x_a - x_i) \right) + c^2 \left( \sum_{i=1}^{n-1} \sum_{j=1}^{n-1} x_i x_j \right)$

$$\text{and } G_2 = x_1^2 + c \left( \sum_{i=1}^{n-1} x_i(x_i - x_1) \right) - c^2 \left( \sum_{i=1}^{n-1} \sum_{j=1}^{n-1} x_i x_j \right).$$

Since  $n - 2 \equiv 1 \pmod{3}$ , we see that the  $c^2$  terms cancel in  $G_1 + G_2$ . We also note that  $x_i(x_i - x_1) = x_i(x_1 + x_1 - x_i) - x_i^2$  for all  $i$ , so  $G_1 + G_2 = x_1^2 - c \left( \sum_{i=1}^{n-1} x_i^2 \right) + \sum_{a=1}^{n-1} -(x_1 - x_a)^2 + c \left( \sum_{i=1}^{n-1} x_i(x_1 + x_a - x_i) \right)$ .

$$\begin{aligned} G_1 + G_2 &= x_1^2 - c \left( \sum_{i=1}^{n-1} x_i^2 \right) + \sum_{a=1}^{n-1} -(x_1 - x_a)^2 + c \left( \sum_{i=1}^{n-1} x_i(x_1 + x_a - x_i) \right) \\ &= x_1^2 - c \left( \sum_{i=1}^{n-1} x_i^2 \right) + \sum_{a=1}^{n-1} -x_1^2 - x_a^2 + 2x_a x_1 + c \left( \sum_{i=1}^{n-1} x_i(x_1 + x_a - x_i) \right) \\ &= x_1^2 - c \left( \sum_{i=1}^{n-1} x_i^2 \right) + \sum_{j=1}^{n-1} -x_1^2 - x_j^2 + 2x_j x_1 + c \left( \sum_{i=1}^{n-1} x_i(x_1 + x_j - x_i) \right) \\ &= x_1^2 + -(n-1)x_1^2 - c \left( \sum_{i=1}^{n-1} x_i^2 \right) + \sum_{j=1}^{n-1} -x_j^2 - x_j x_1 + c \left( \sum_{i=1}^{n-1} x_i(x_1 + x_j - x_i) \right) \\ &= 2x_1^2 - c \left( \sum_{i=1}^{n-1} x_i^2 \right) + \sum_{j=1}^{n-1} (-x_j^2 - x_j x_1) + c \left( \sum_{i=1}^{n-1} \sum_{j=1}^{n-1} x_i x_1 + x_i x_j - x_i^2 \right) \\ &= \sum_{j=2}^{n-1} (-x_j^2 - x_j x_1) - c \left( \sum_{i=1}^{n-1} x_i^2 \right) + c \left( \sum_{i=1}^{n-1} \sum_{j=1}^{n-1} x_i x_1 + x_i x_j - x_i^2 \right) \\ &= \sum_{j=2}^{n-1} (-x_j^2 - x_j x_1) - c \left( \sum_{i=1}^{n-1} x_i^2 \right) + c \left( \sum_{i=1}^{n-1} \sum_{j=1}^{n-1} x_i x_j \right) - c \left( \sum_{i=1}^{n-1} x_i x_1 - x_i^2 \right) \\ &= \sum_{j=2}^{n-1} (-x_j^2 - x_j x_1) - c \left( \sum_{i=1}^{n-1} x_i^2 \right) + c \left( \sum_{i=1}^{n-1} \sum_{j=2}^{n-1} x_i x_j \right) + c \left( \sum_{i=1}^{n-1} x_i^2 \right) \\ &= \sum_{j=2}^{n-1} (-x_j^2 - x_j x_1) + c \left( \sum_{i=1}^{n-1} \sum_{j=2}^{n-1} x_i x_j \right) \end{aligned}$$

Then a simple change of indices tells us that  $cG_1 + cG_2 = \partial_1 f_1$  as desired.

### 1.2.2 $D_2 f_1$

We see that  $D_2 f_1 = \partial_2 f_1 - c \frac{f_1 - s_{12} f_1}{x_2 - x_1} + \dots$

## 1.3 Complete intersection

Then we see that the ideal  $I$  generated by  $f_1, \dots, f_{n-1}$  has  $I \subseteq J$  where  $J$  is the kernel of the  $\beta$  form, since the generators  $f_1, \dots, f_{n-1}$  are killed by the Dunkl operators.

Let  $I$  be the ideal generated by  $f_1, \dots, f_{n-1}$ . We will show that  $A/I$ , where  $A = k[x_1, \dots, x_{n-1}]$ , is a complete intersection by showing that  $f_1(x) = \dots = f_{n-1}(x) = 0$  implies  $x = 0$ .

A simple algebraic manipulation lets us see that  $f_a = -x_a^3 + cx_a^2 \left( \sum_{i=1}^{n-1} x_i \right) + (c^2 + 2c)x_a \left( \sum_{i=1}^{n-1} x_i \right)^2 + x_a \left( \sum_{1 \leq i < j \leq n-1} 2cx_i x_j \right)$ . We also note that  $\sum_{i=1}^{n-1} f_i = (c^2 + 2) \sum_{i=1}^{n-1} x_i^3 = (c^2 + 2) \left( \sum_{i=1}^{n-1} x_i \right)^3$ . Therefore if  $f_1(x) = \cdots = f_{n-1}(x) = 0$ , we see that  $\sum_{i=1}^{n-1} x_i = 0$ . Modulo this new relation, we see that  $f_a = x_a \left( -x_a^2 + \sum_{1 \leq i < j \leq n-1} 2cx_i x_j \right)$ . Therefore if  $f_a = 0$  for all  $a$ , we see that for each  $a$ , either  $x_a = 0$  or  $x_a$  is a square root of  $C = \sum_{1 \leq i < j \leq n-1} 2cx_i x_j$ . If  $C = 0$  or  $C$  has no square roots, then all the  $x_a$  are 0 and we are done; so we assume  $C$  has two square roots which are additive inverses of each other. Then each pair  $x_i x_j$  either multiply to  $\pm C$  or 0, so  $C = 2cmC$  for some integer  $m$ . Then  $(1 + cm)C = 0$ ; if  $C \neq 0$ , then  $1 + cm = 0$ ; however,  $m$  is an integer, so this is impossible. Therefore  $C = 0$ , so all the  $x_a$  are 0.

Therefore  $f_1(x) = \cdots = f_{n-1}(x) = 0$  implies  $x = 0$ , so  $A/I$  is a complete intersection; it then must have Hilbert polynomial  $h_{A/I}(t) = (t^2 + t + 1)^{n-1}$ .

By Proposition 3.4 in <http://arxiv.org/abs/1107.0504>, we see that the Hilbert polynomial of  $A/J$  is  $(t^2 + t + 1)^{n-1}h(t^3)$  for some polynomial  $h$  with nonnegative integer coefficients; since  $I \subseteq J$ , we see that  $h_{A/I}(t) \geq h_{A/J}(t)$  coefficientwise; however by this restriction of the form of  $h_{A/J}(t)$ , we see that the only possible choice for  $h$  is  $h(t) = 1$ . Therefore  $h_{A/I}(t) = h_{A/J}(t)$ , so  $I = J$  and these  $n - 1$  generators generate the whole ideal.
